Water Quality Data

The data below lists all the drinking water contaminants that were **detected** during the 2018 calendar year. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table are from testing done January 1 through December 31, 2018. The State requires that we monitor for certain contaminants less frequently than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. As a result, some of the data, though representative of water quality, may be more than one year old. Camrosa Water District monitors its water supplies for over 150 contaminants annually.

Public Health Goal (PHG) = The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

(A) The turbidity level of the finished water shall be less than or equal to 0.3 NTU in 95% of the measurements taken each month and shall not exceed 1.0 NTU at any time in the distribution system (B) Compliance is based on a running annual average for each of 4 sample sites taken quarterly in the distribution system. Values reported reflect the highest and lowest single value in the distribution

Treatment Technique (TT) = A required process intended to reduce the level of a contaminant in drinking water.

system (range) and the highest running annual average for all 4 sites.

Action Level (A.L.)= The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Where does my water come from?

Camrosa Water District operates seven wells in addition to importing water from Calleguas Municipal Water District (a distributor for the Metropolitan Water District of Southern California). About 45% of your water comes from these local wells and the rest is imported. Four of our wells are directly blended with imported water before being released into the distribution system, two wells are disinfected and pump water directly into the system, and the last well feeds our Reverse Osmosis Filtration Plant which produces high quality drinking water equivalent to Import. Generally, imported water is of higher quality than that found locally, but is more expensive as its source lies so far away. Camrosa uses a combination of imported and local water to provide its customers quality drinking water at a reasonable cost.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo o hable con alguien que lo entienda bien.

Dear Customer,

In compliance with the California Department of Public Health and the U.S. Environmental Protection Agency (EPA), this Consumer Confidence Report provides you with information about the sources and quality of your tap water in 2018. Camrosa Water District continues to *meet or exceed* all federal and state drinking water standards. We analyze your water for more than 150 chemical constituents; the data tables appearing in this report contain only detected contaminants. This testing is in addition to weekly and monthly testing that we conduct to ensure the safety and integrity of our distribution system.

2018 marked the first year that water districts were required to participate in the School Lead Sampling Program. We know that lead in drinking water is an issue of particular concern to parents, so we're pleased to report that the four schools in Camrosa's service area passed all required lead testing.

Camrosa's continuing work toward building self-reliance is reflected in our efforts to develop and diversify local sources of supply. Since 2015, we've operated our Reverse Osmosis Water Treatment Plant, producing 1 million gallons per day of drinking water from previously unusable, local groundwater sources. In addition, we are currently in the process of constructing another well to extract water from inside the District.

By improving our local water resources through infrastructure projects, collaboration with other regional water agencies, and regular water quality testing, we will continue to deliver safe and plentiful high quality drinking water for all needs within the District

If you have any questions or concerns about your water quality, or anything appearing in this report, please contact me at (805) 482-8563 or mphelps@camrosa.com.

Sincerely,

Michael J. Phelps Water Quality Manager

Camrosa Water District is governed by a five member Board of Directors elected by you, the customers. The Board meetings are public and held twice a month on Thursdays at 7385 Santa Rosa Road in Camarillo at 5:00 P.M. The Board agenda is posted at the front door of the office three days prior to the meeting. You can also access the agenda on our website at www.camrosa.com.

What contaminants can be found in drinking water?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, and wells. As water travels over the surface of the land, or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or a result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial process and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the State Water Resources Control Board Department of Drinking Water (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

<u>Lead</u>

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Camrosa is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/lead.

Who might be more susceptible to contaminants in drinking water?

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Nitrate in drinking water at levels above 10 mg/L is a health risk for infants of less than six months of age. High nitrate levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in a serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate Levels above 10 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity.

While your drinking water meets the federal and state standard for arsenic, it does contain low levels of arsenic. The standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. The U.S. Environmental Protection Agency continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

An assessment of the drinking water sources for Camrosa Water District was completed in May, 2002. The sources are considered most vulnerable to these activities: agricultural drainage ,fertilization, sewer collection , dry cleaning services, pesticides, petroleum storage and septic systems.

A copy of the complete assessment is available at the Camrosa Water District Office, 7385 Santa Rosa Rd. Camarillo, CA 93012. You may request a summary of the assessment be sent to you by contacting Michael Phelps at (805) 482-8563.
